Luke 10:22 The miracles that Jesus did were so extraordinary and God could have dropped the hammer at any time and would have still come through and saved the world. Effect of pressure on the energetic properties of the excited state of water. We report calculations on the energetics of the excited state of liquid water and compare the results to experiments where the external pressure is varied. The shape of the potential energy curve (PEC) of the S0 state and the spectral shape of the S0 → S1 transition differ from the PEC obtained from previous calculations and from the experimental data. Using the four-point Wigner-Kirkwood statistical theory, the calculated root-mean-square displacement of the molecules along the intermolecular axis is found to increase by about 5% from atmospheric to 5 GPa and is in good

agreement with the experimental data. Using the three-dimensional (3D) cluster embedded in the empirical three-site cluster expansion model, the PEC of the S_0 state is calculated in the pressure
